

AI Product Case Study: PA Copilot — Agentic AI for Pricing Operations

Problem

Pricing analysts spent hours navigating multiple dashboards and APIs to analyze demand, competitor pricing, and route performance before making pricing decisions.

My Role

Owned the product end-to-end—identified user pain points, designed AI workflows, prioritized capabilities, defined evaluation metrics and guardrails, and partnered with engineering to build and launch the solution.

Solution

Built **PA Copilot**, an enterprise AI agent that orchestrates **33 internal tools** through natural language.

Tech Stack: Google ADK, Gemini, MCP, Python, FastAPI, Pandas, REST APIs, Server-Sent Events (SSE), TDSA Recommendation Engine, GDS Analytics, Live SRP APIs, Competitor Intelligence APIs, automated testing, and evaluation pipelines.

Impact

- Reduced pricing analysis time by **~70%** for early analyst adopters.
- Built a production-grade **LLM evaluation framework** with **80 golden test cases across 7 workflow suites**, achieving a **98% pass rate** while evaluating tool-call precision, parameter correctness, response grounding, and latency using code-based, human, and LLM-as-judge graders.
- Established production guardrails that enabled reliable deployment of an agentic AI system for enterprise pricing workflows.

Vision

North Star: Reduce operator onboarding from **4 days to under 15 minutes** through a fully self-serve AI pricing assistant. PA Copilot is the first step toward that vision.
